

10 Reasons Why **Not** to Vaccinate Your Children

Vaccinating a child or not is an important decision that every parent must make. But not all parents understand the true risks involved, risks that could leave a child **debilitated for life**, or even **kill him**. The pro-vaccine mafia is quick to sweep all cases of vaccine-related injury and death under the rug as extremely rare anomalies, but many a parent of a vaccine-injured child will be the first to tell you that, if she could do it all over again, she wouldn't have let her kid get jabbed.

If your doctor, your child's school administrator, or a friend or family member is pressuring you to inject your child with genetically modified (GM) viruses, heavy metals and preservatives, and you're not sure how to make the best and most informed choice in the matter -- or even how to respond back to these people intelligently in order to shut them up -- consider the following 10 reasons **not** to go the vaccination route.

1) Vaccines don't work. When printed on a poster or repeated *ad nauseam* by the Centers for Disease Control and Prevention (CDC), the embedded claim that vaccines prevent communicable disease and impart lasting immunity might sound nice to the low-information masses. But the science simply doesn't reinforce it, with outbreak after outbreak proving that **vaccinated people are the most immunocompromised**, and are always the ones contracting the diseases against which they were vaccinated.

Dr. Tetyana Obukhanych addresses this and many other vaccine facts in her powerful book *Vaccine Illusion*, which destroys many modern myths surrounding vaccination. Not only do vaccines **not** impart lasting immunity, but they actually destroy the body's natural immune capacity, leaving many vaccinated individuals immuno-debilitated throughout their lives.

2) Vaccines have never been proven safe or effective. Every single study used as "evidence" that vaccines are safe **erroneously compares side effects from one vaccine to side effects from another vaccine**, effectively canceling them out. None of them compare the health outcomes of vaccinated versus unvaccinated individuals, which would be the true test of vaccine safety.

"True, scientific, double-blind placebo studies have never been conducted on vaccines to determine their safety," explains *VacTruth.com*.

3) The first vaccine was a complete failure, which the industry tried to cover up. Little do most people know that the first vaccine ever produced (which was for smallpox) was a complete disaster. The health consequences in those who received it included **syphilis and death**, though a concerted effort was made at the time to **cover up these outcomes and push vaccines anyway because they're highly profitable**.

4) Vaccines are highly profitable for drug companies, which aren't held liable for damages. Let's face it -- vaccines are a major cash cow for the drug industry. Not only are vaccine companies **completely shielded from liability** when their vaccines injure or kill children, but they are typically "sponsored" by government agencies that push them on families and children using outrageous and unfounded scare tactics.

5) All vaccines contain deadly chemical additives. The average pediatrician would be hard-pressed to provide package inserts outlining vaccine ingredients to their clients prior to pushing vaccines. But parents need to know that **all vaccines contain deadly, neuro-damaging chemicals like aluminum, mercury and formaldehyde**. Many vaccines are also loaded with **monosodium glutamate (MSG), antibiotics and even genetically modified organisms (GMOs)**.

6) Unvaccinated children are generally healthier. International studies looking at the health outcomes of unvaccinated children compared to their vaccinated peers have repeatedly shown that the un-jabbed are **generally less afflicted with allergies, autism, behavioral disorders, autoimmune dysfunction and respiratory ailments**.

Concerning the flu vaccine, for instance, a study published in the journal *Clinical Infectious Diseases* found that individuals jabbed for influenza are **550 percent more likely to have respiratory problems**.

7) Vaccines cause lifelong, incurable diseases in some children. It's one thing to have

localized swelling or temporary fever symptoms following vaccinations. But if your child is one of the unfortunate ones who develops permanent nerve damage in the form of Guillain-Barre Syndrome, for instance, he or she could require **lifelong care and treatment for vaccine damage**. If you choose to vaccinate, are you prepared to potentially have to reorient your life in the event of autism or brain damage?

8) Vaccines kill children and adults. Though young children and babies are most prone to incurring permanent harm from vaccines, adults are also at risk. One prevalent example of this is the infamous Gardasil vaccine for HPV, which to date has injured and killed **tens of thousands of adolescents and teenagers**.

"US children are given far more vaccines at younger ages compared to other countries," explains *VacTruth.com*, noting that vaccines are also linked to the fatal condition SIDS (sudden infant death syndrome), which the medical establishment blames on genetics or child abuse in order to protect the vaccine sham.

9) Vaccine companies can't be sued if you or your child is harmed by vaccines. If vaccines really are as safe as the jab-pushers constantly claim they are, then why was the National Childhood Vaccine Injury Act passed in 1986, exempting vaccine and drug companies, as well as health practitioners, from liability in the event of injury or death?

In 2011, the Supreme Court affirmed that injured parties **can't sue vaccine companies** for injury or death related to vaccines. Is this really a risk that you want to take with your child?

10) Natural exposure to disease is the best vaccine. Truth be told, the only way to truly develop vibrant, lifelong immunity is to **live your life** as you normally would, but without injecting dead (and in some cases live) viruses and chemical adjuvants into your muscle tissue. Natural exposure to whatever diseases are lurking in the world is **the only way** for the body to develop permanent antibodies that will forever protect against disease. Eating fresh, nutrient-dense organic food and living a healthy lifestyle also helps boost your immune system, allowing you to overcome and develop resistance to diseases naturally.
